No. is the number of results predicted by chance to have score greater than or equal to the score of the result being pu and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                       121

This toxin blocks N-type calcium channels.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed by the venom duct.
PHARMACEUTICAL: Is under clinical trial by Neurex. It blocks acu pain in patients who no longer obtain relief from opiate drugs. is 100 to 1000 times more potent than morphine. By blocking is 100 to 1000 times more potent that transmit pain signals. Calcium channels it disable nerves that transmit pain signals.
SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TY

FUNCTION: Omega-conotoxins act at presynaptic membranes, and block voltage-sensitive calcium channels (VSCC) (By and block voltage-sensitive calcium channels.

similarity). This toxin blocks N-type calcium channels.

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: Expressed by the venom duct.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MUTAGEN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FUNCTION: Kappa-conotoxins bind and inhibit voltage-sensitive potassium channels. The rat brain voltage-gated potassium channel protein Kv1.1 is resistant to this toxin, but the voltage-gated potassium channel protein Shaker (Drosophila) is sensitive. The interaction site between the Shaker channel and this toxin is within the S5-S6 loop of the Shaker channel. In fish, this toxin induces hyperactivity, followed by continuous contraction and extension of major fins, without immobilization or death. Injection of this peptide together with the delta-conotoxin PVIA causes the sudden tetanus of prey (STOP) syndrome, which is a state of the state of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CAUTION: Because analogs resulting of mutagenesis of Hyp-49, 50, Leu-57 and Asp-59 gave very low yields upon folding, the results of mutagenesis on these residues should be interpreta

SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed by the venom duct.
SIMILARITY: BELONGS TO THE O-SUPERFAMILY OF CONOTOXINS. OMEGA-TYPE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            {\tt MKLTCVVIVVVLFLTACQLITADDSRRTQKHRALRSTTKLSLSTRCRIPNQKCFQHLDDC}

SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Expressed by the venom duct.
MISCELLANEOUS: Veratridine increases the rate of dissociation dose-dependent manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and rat central nervous system, but despite its high affinity binding to rat sodium channel, it has no functional effect in vivo and in vitro on it. Has also no effect on Gambusia fish. Is important in mollusk for the paralysis of the prey. Upon injection of the peptide, a subordinate lobster assumes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS

The invention relates to isolated omega-conopeptides, nucleic acid consequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, canticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cerebroprotective, cardiant, neuroprotective, cerebroprotective, antingraine, antidabetic, cerebrotes, cerebrotes, antipsychotic, anxiolytic and neuroleptic. Cerebrotes, cer

tranquilliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gas ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be unigraine; inflammation or cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder;
                                                                                                                                                                                                                                                                                                                                                                                                             for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analyesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in records ABB96595-ABB96697 represent omega-conopeptide propeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotectrovascular, antiinflammatory, antimigraine, antidiabetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New omega-conopeptides useful for treating voltage gated ion channels e.g. pain, inflactardiovascular disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquiliser; vulnerary; antipsychotic;

                                                                                                                                                                                                                                                         brocade come shell (Conus textile) or the line cone shell (Conus striatus). The cDNA sequences were used to determine the conotoxin precursor protein sequences, and the sequences of the mature conotoxin peptides were inferred from the precursor sequences. The mature conotoxin peptides can be obtained via chemical synthesis or by in vitro gene expression. Conotoxins inhibit the function of neurons and muscle cells. Certain conotoxins interfere with synaptic transmission, while others act on muscle or at the neuronuscular junction. The 14 novel conotoxins have unique receptor specificity and affinity, so can be used as screening tools to identify new drugs. Conotoxin #11 (AAX87540) may be used for pain relief. Sequences AAX87421, AAX87533, AAX87559, AAX87541, AAX87529, AAX87531, AAX87533, AAX87537, AAX87539, AAX87541, AAX87543, AAX87545 and AAX87547 represent the precursors of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CN1237584-A

The invention relates to isolated omega-conopeptides, nucleic acid CC sequences encoding them, and propeptide sequences. The activity of CC the peptides of the invention may be described as, analgesic, CC anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, CC cardiovascular, antiinflammatory, antimigraine, antidiabetic, CC tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. CC peptides of the invention act by modulating the activity of voltage gated CC ion channels. They may be used for treating or preventing disorders CC associated with voltage gated ion channels such as neurological CC disorders, e.g. seizure (associated with epilepsy), neurotoxic injury CC associated with conditions of hypoxia, anoxia, ischaemia, stroke, CC crebrovascular accident, brain or spinal chord trauma, drowning, CC suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. CC migraine; inflammation or cardiovascular disorders. They may also be used CC for treating psychiatric disorders e.g. psychosis, anxiety or CC schizophrenia. The analgesic agents of the invention show diminished side effects and toxicity, and are non-addictive. The sequences given in CC records ABB96597-ABB96697 represent omega-conopeptide propeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; carebroprotective; cardiovascular; antinflammatory; antimigraine; antiddabetic; tranquiliser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; magraine; inflammation; cardiovascular disorder; psychiatric disorder; psychosia: anylativ. schiepshysia;

The invention relates to isolated omega-conopeptides, nucleic acid sequences encoding them, and propeptide sequences. The activity of the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebroprotective, cardiovascular, antiinflammatory, antimigraine, antidiabetic, tranquiliser, vulnerary, antipsychotic, anxiolytic and neuroleptic. Peptides of the invention act by modulating the activity of voltage gated ion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Omega-conopeptide; analgesic; anticonvulsant; vasotropic; cardiant; neuroprotective; cerebroprotective; cardiovascular; antiinflammatory; antimigraine; antidiabetic; tranquillser; vulnerary; antipsychotic; anxiolytic; neuroleptic; voltage gated ion channel; seizure; epilepsy; neurological disorder; neurotoxic injury; hypoxia; anoxia; ischaemia; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; stroke; cerebrovascular accident; brain trauma; spinal chord trauma; drowning; suffocation; perinatal asphyxia; hypoglycaemic event; pain; migraine; inflammation; cardiovascular disorder; psychiatric disorder.

migraine; inflammation or cardiovascular disorders. They may also be for treating psychiatric disorders e.g. psychosis, anxiety or schizophrenia. The analgesic agents of the invention show diminished effects and toxicity, and are non-addictive. The sequences given in records ABB96595-ABB96697 represent omega-conopeptide propeptide

The invention relates to isolated omega-conopeptides, nucleic acsequences encoding them, and propeptide sequences. The activity the peptides of the invention may be described as, analgesic, anticonvulsant, vasotropic, cardiant, neuroprotective, cerebropic cardiovascular, antiinflammatory, antimigraine, antidiabetic.
                                                                                                                                                                                                                                                                                                                    (UTAH )

Peptides of the invention act by modulating the activity of voltage gardion channels. They may be used for treating or preventing disorders associated with voltage gated ion channels such as neurological associated with voltage gated ion channels such as neurological disorders, e.g. seizure (associated with epilepsy), neurotoxic injury disorders, e.g. seizure (associated with epilepsy), neurotoxic injury associated with conditions of hypoxia, anoxia, ischaemia, stroke, cerebrovascular accident, brain or spinal chord trauma, drowning, suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. suffocation, perinatal asphyxia or hypoglycaemic events; pain e.g. migraine; inflammation or cardiovascular disorders. They may also be undertained the contraction of cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     records ABB96595-ABB96697 represent omega-conopeptide propeptide
